

INTELLIGENT POSITIONER HP

This is an instrument that is very user friendly, compact, versatile and above all, intelligent.

The technology uses a small, modern, powerful microprocessor that is able to make the calculations needed to pre-determine the bending radii.

The main feature of this instrument is the **possibility to pre-determine the bending radius**. There is no need for the operator to waste time and material to find the required bending radius. All that is necessary is to enter the bending radius and the roll will position on the calculated point.

The pre-determination is possible both for a single pass (to prepare many parts) or in multi-pass (for the preparation of fewer parts).

The electronic arc meter ARC 50/300 is supplied with the machine for the immediate reading of the bending radii. This instrument is indispensable to be able to use the bending radius pre-determination program with the Intelligent Positioner

TECHNICAL DATA

Number of soft keys	15
Number of characters	6
Height of display characters	13.2 mm
N° dimensions that can be stored	20
N° programs that can be stored	10
N° values that can be set for each program	10
10 bar sections that can be stored for the pre-determination of the bending radii in single pass or multi-pass
